### Frequently Asked Questions

**Q. Why do organizations consider migration?**

A. Organizations may have any number of reasons driving a migration initiative, including:

- Content consolidation
- Merger & Acquisition activity
- Platform upgrade or vendor change
- Meeting internal or external compliance requirements
- Building a disaster recovery solution
- Implementing an archiving process

**Q. How are SeeUnity's migration products different from other offerings?**

A. SeeUnity migration is product oriented, not services intensive. On average, 80% of customer content can be migrated using our pre-packaged tools. SeeUnity's metadata management products go well beyond many competitive migration offerings.

**Q. Will we be able to migrate field data, policies and other information?**

A. Yes. SeeUnity's repository connector libraries use native APIs to speak to content sources. Virtual folders, authors, fields, records, permissions, policies and other metadata are selectively migrated with associated content, including versions, sub-versions, attachments, etc.

**Q. Aside from the features of our ECM repository of choice, can migrating with SeeUnity provide additional benefits?**

A. SeeUnity can improve the overall strength of your content repository with:

- Metadata conversion, expansion and improvement
- Content reorganization and re-folding
- User and group permissions modification
- Data purging
- Multi-destination replication and migration for disaster recovery
- PDF conversion for archiving

**Q. Will undertaking migration place a burden on my IT staff and resources?**

A. SeeUnity technology minimizes the burden placed on IT departments. Our offerings have been designed to operate largely out of the box and offer the ability to create reusable migration templates and scripts. SeeUnity seeks to minimize the role of professional services and training required. This results in faster, lower cost migrations.

**Q. How can we be assured of migration reliability?**

A. SeeUnity recognizes that content is a core asset to your organization. Migration processes can be fully tested before production. Scheduling and throttling features prevent resource overload, and audit and error logs keep administrators apprised of the migration process. No native versions of content are deleted during the migration process.

**Q. How does migration return “content control” to the customer?**

A. By having SeeUnity core integration services in place – companies can enable powerful integration and coexistence strategies. By enabling employees to access all enterprise content from a common interface without physical consolidation, organizations can plan eventual migrations at a time of their choosing. Instead of letting ECM vendors impose their interests upon customers to upgrade or embrace certain offerings, customers can dictate the terms of their content roadmap.

SeeUnity is a leading developer of Enterprise Content Integration solutions that enable users to search, access, and manage all enterprise content from a common interface. Our products bridge content platforms, and remove the barriers between content silos. SeeUnity brings content together.
